

What You Should Know About Aortic Disease

When your doctor suspects an aortic problem, rest assured: your destination for top-level diagnosis and treatment is as close as Stony Brook Medicine. A regional referral center serving Long Island and beyond, the Stony Brook Aortic Center offers comprehensive, coordinated care by renowned specialists in vascular surgery, cardiothoracic surgery, cardiology, cardiac imaging, radiology and anesthesiology.

What should I know about the aorta and aortic problems?

The aorta is the main vessel carrying oxygenated blood from the left ventricle of the heart to other parts of the body. The aorta ascends from the top of the heart, arches up and over it, descends through the chest behind the lungs and in front of the spine to the abdomen, and then branches off at the pelvis. Aortic diseases can occur for many reasons and often develop in tandem with coronary artery disease. The biggest risk factors for aortic diseases are being male, over age 55, a smoker and having high blood pressure or heart disease — but anyone can develop an aortic condition at any age.

What conditions do you treat?

We treat patients with the full spectrum of aortic problems, including those with co-existing conditions and other high-risk factors. The most common aortic problem is an aneurysm, which is a blood-filled bulge in a blood vessel resulting from a weakening in the vessel wall. Small aortic aneurysms often can be managed medically and monitored for change; larger aortic aneurysms usually require treatment either with surgery or

by using a stent graft to bridge the damaged area. We repair aneurysms located anywhere on the aorta, with the most common being abdominal aortic aneurysms, also known as AAAs. We also treat all other clinical problems related to the aorta or to the arteries that branch from it to the gastrointestinal tract, the kidneys and the extremities.

Is it true that many advanced procedures are minimally invasive?

Yes. At Stony Brook, we can offer lifesaving options to otherwise inoperable patients and treat a wider spectrum of patients with shorter hospital stays and fewer postoperative complications. In fact, the vast majority of the AAAs done at Stony Brook are minimally invasive and we now provide incisionless repair of AAAs for patients meeting the criteria.

What procedures put you at the forefront of care?

Customized AAA stent grafts. We are the only facility in Suffolk County offering custom-built endovascular stent grafts for patients who cannot be treated with a standard stent graft, either because of a complex anatomy or the location of the aneurysm. This unique capability requires highly sophisticated imaging technology and the collaboration of surgeons and radiologists. Together they develop a complex 3D model of the area of the patient's aorta requiring repair and a stent graft is then custom built to match it.

Incisionless repair of abdominal and thoracic aneurysms. We can now repair abdominal and thoracic aortic aneurysms without a surgical incision. Both procedures — percutaneous EVAR (endovascular aneurysm

repair) and TEVAR (thoracic endovascular aneurysm repair) — result in less discomfort for the patient and less potential for wound infection.

Endovascular and hybrid thoracic aortic aneurysm repairs. We repair aneurysms of the thoracic aorta with endovascular techniques using stent grafts similar to the AAA procedure, or in more complex cases, we offer a hybrid open endovascular procedure that helps reduce the magnitude of surgery and the patient's recovery time.

Minimally invasive treatment of acute aortic dissections. Aortic dissection repairs also may be treated with stent grafts — a significant advance over what once was a dangerous open surgery. An aortic dissection occurs when the thin, layered walls of the aorta tear or separate, causing blood to travel between the layers. Acute dissections may require emergency surgery to avoid rupture and restore blood flow to the organs and legs. Our group of specialists collaborate to treat all of these conditions in the most safe and effective way.

FREE VASCULAR SCREENING

Saturday, September 27, 8 am to 4 pm

Stony Brook University Heart Institute
Call (631) 638-2100. Registration required.

**Are you 60 or older?
Are you a current or past smoker?**

Other risk factors for vascular disease include diabetes, high blood pressure, high cholesterol, heart disease or a family history of aortic aneurysm. Call for a brief qualifying interview.

Physicians who suspect that you have an aortic problem can call (631) 444-2683 to initiate your care.

If you are curious about a certain medical topic and would like to learn what an expert thinks about it, let us know. Although we cannot offer individual medical advice in this column, we'd be happy to choose our next topic from among your suggestions. From arrhythmias to zoster virus, we have top specialists in virtually every area of medicine who can answer your questions. Email us at MedicalExperts@stonybrookmedicine.edu or write to: Medical Experts at Stony Brook, 188 Belle Mead Road, East Setauket, NY 11733-9228. If you need a physician, call HealthConnect® at (631) 444-4000.
